But the most-cited publication of 2012 is a 583-page manual about PYTHIA, a program for simulating particle collisions and their byproducts.

Min Forskning

Teorien om den stærke kernekraft: Kvante-Chromodynamik (QCD)

Kvarker og Gluoner

+ Hadroner = bundne tilstande af kvarker (og antikvarker)

Mesoner (kvark-antikvark): pioner, kaoner, p mesoner, ... Baryoner (triple-kvark): protoner, neutroner, hyperoner, ...

Bremsstrahlung

Når du sparker en kvark, stråler den gluoner (Jvf elektriske ladninger, der stråler fotoner)

Hadronisering

Når kvarker og gluoner bliver 'kolde' bindes de i hadroner Der opstår 'gluon-strenge' mellem dem, som bryder op Den process forsøger vi at modellere og forstå

"Monte Carlo event generators"

- Kvante-sandsynligheder → tilfældige tal
- → tilfældige begivenheder, som i eksperimentet ~ en 'virtuel accelerator'
 - Used by experiments to give "theory predictions", to compare with data
 - Used to design and optimize detectors and analysis strategies
 - Used by theorists to explore new solutions, new ideas, new physics

Not a computer scientist. But the numerical calculations I (want to) do require a lot of power \rightarrow distributed computing: farms / GRID / clouds.

P. Skands

LHC@home 2.0

Test4Theory - A Virtual Atom Smasher

Over 1000 billion simulated collision events

Test4Theory - LHC@home

http://lhcathome.cern.ch/test4theory

LHC@home 2.0 Test4Theory volunteers' machines seen since Sun Nov 17 2013 14:00:00 GMT+1100 (EST) (2804 machines overall)

The LHC@home 2.0 project <u>Test4Theory</u> allows users to participate in <u>running</u> <u>simulations of high-energy particle physics</u> using their home computers.

The results are submitted to a <u>database</u> which is used as a common resource by both experimental and theoretical scientists working on the <u>Large Hadron Collider</u> at CERN.

New: Citizen Cyberlab (funds from EU)

Develop an app that lets citizen scientists learn about, interact with, and optimize high-energy physics simulations, by comparing them to real data

Why?

the building blocks of Life

The Carbon in our bodies

The Nitrogen

... were made in stars ...

The Oxygen that we breathe

All I know for sure: Nature is a **Fantastic Work of Art** Where did it come from? What is it? Where is it going?

It inspires us to think beyond ourselves

Atomic Theory

1000

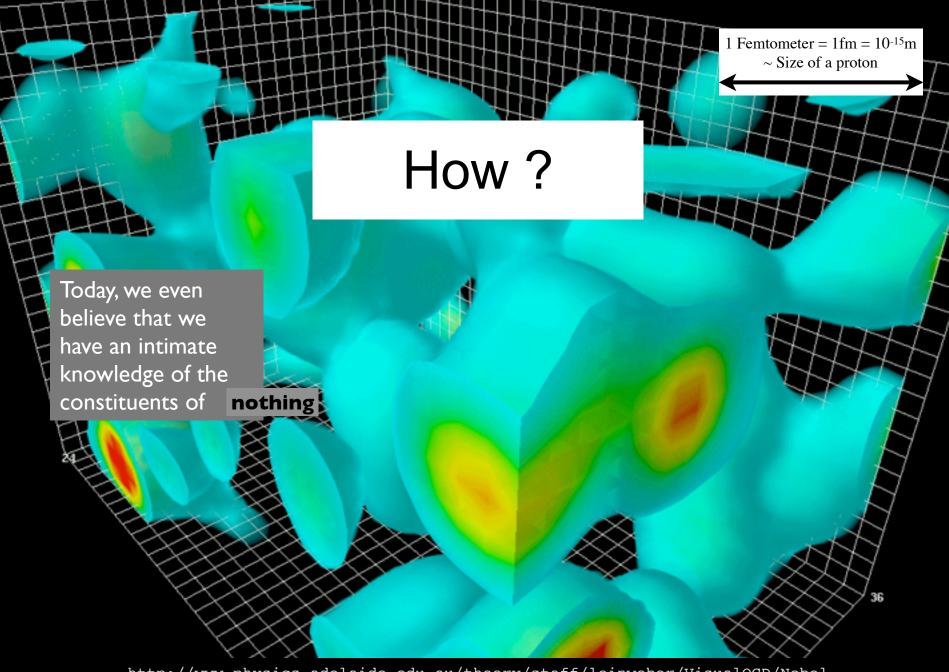

Stockholm, 1922

"The present state of atomic theory is characterised by the fact that we not only believe the existence of atoms to be proved beyond a doubt, but also we even believe that we have an intimate knowledge of the constituents of the individual atoms ..."

Niels Bohr (1885-1962)

High Energy Physics

The true nature of the **strong nuclear force** is revealed at distances below about 10^{-15} m (= 10^{-6} nm)

To "see" something that small: need high energies (wavelength inversely proportional to energy): kick an electron with 1 billion Volts = 1 Giga-electron-Volt (GeV)

The energy of the Large Hadron Collider at CERN: 8 TeV

In computer simulations, we try to recreate the collisions happening in the LHC in as much detail as mother nature. The clarity of our vision of the **Terascale** depends on their accuracy. You can help \rightarrow LHC@home 2.0

"the Terascale"

the real Accelerators

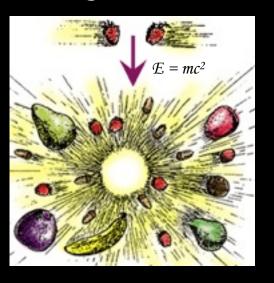

1932: Cockroft & Walton built a system that could fire protons, like bullets, into metal targets: p + LiF → Be, He, O, ...

(Nobel 1951) "Transmutation of atomic nuclei by artificially accelerated atomic particles"

Particle Accelerators

> The goal:

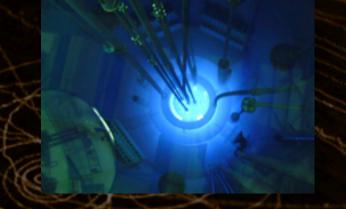

- ☐ Accelerators are 'optical' systems, with
 - ☐ Light → charged particles
 - ☐ Lenses → magnets
 - \square Wave length shortening \rightarrow particle acceleration

- Relative to combustion of 1 kg of octane molecules (gasoline):
 - 100m **Waterfall** : 0.000 025
 - Burning wood: 0.3
 - Burning sugar (metabolism): 0.5
 - Burning ethanol or coal: 0.75
 - Burning Beryllium: 1.5

 - **Tevatron** collisions: 2 000 000 000 000
 - LHC collisions: 8 000 000 000 000
- Still, Dan Brown exaggerated a bit in "Angels & Demons" ...
 - "If all of the antimatter ever produced at Fermilab had been collected, we would have a couple of nanogrammes ..."
 Dave Vandermeulen, antimatter expert, Fermilab

-> Fundamental Science

July 4th 2012: "Higgs-like" particle seen at CERN

(+ over 500 other published physics papers from LHC so far)

What is "Mass"?

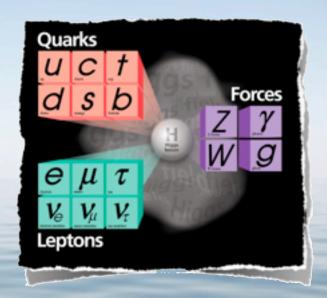

- Consider a 'field' distributed evenly across the Universe, of uniform strength
- Suppose that different particles experience this 'field' as being more or less transparent
 - To a photon (light), the field is completely "translucent"
 - But an electron (or a proton), will interact with it
- Suppose that this field condenses around the particles which couple to it, causing an increased energy density around those particles. Looks like mass (E=mc²).
- We call this field the "H" (or Higgs) Field
- If correct, it should be possible to create waves in the Higgs field itself (though that may require a lot of energy)

The Higgs Particle

- If correct, the Higgs mechanism makes one spectacular prediction: it should be possible to excite a wave in the Higgs field itself
- Made out of pure 'Higgs' stuff, in particle form this wave is known as the 'Higgs particle' or 'Higgs boson'
- This particle would quickly dissolve (decay) into other particles, but should be detectable via its decay products
- The discovery of a particle consistent with these properties was announced at CERN on July 4, 2012
- The coming years will see a huge activity trying to determine all the quantum properties of this new "H particle"

the Last Piece of the puzzle?

Atoms
Neutrinos
Exotic matter
Antimatter

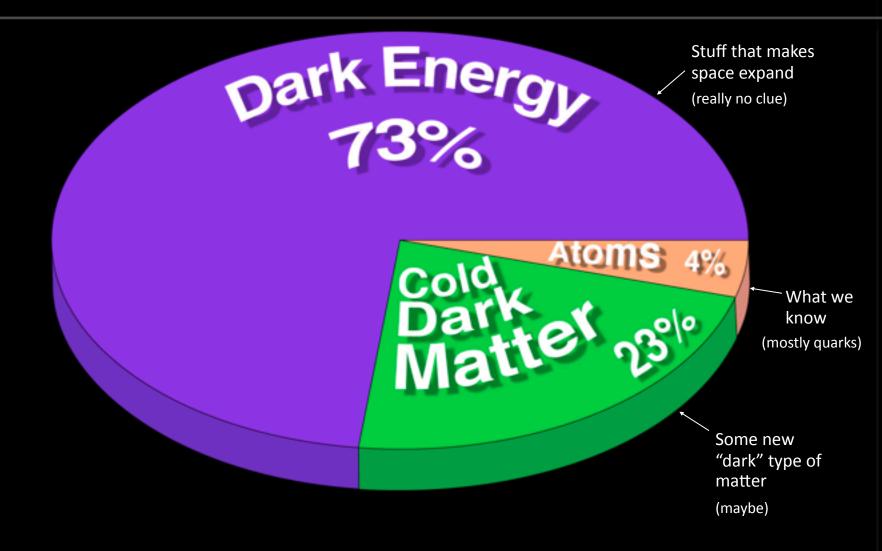

Electromagnetism
The nuclear forces
+ Gravity (Einstein)

+ Mass

Or is there something beyond?

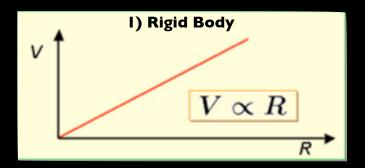

Like: Quantum Gravity? Higgs Origins? Grand Unification? Extra Dimensions? ...

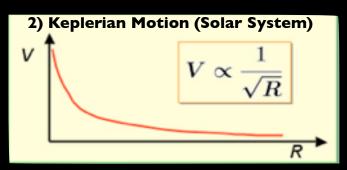

The Dark side of the Universe

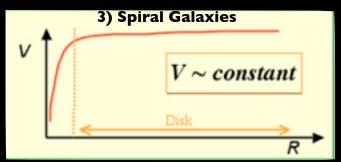

Dark Matter: 23%

Rotation Curves

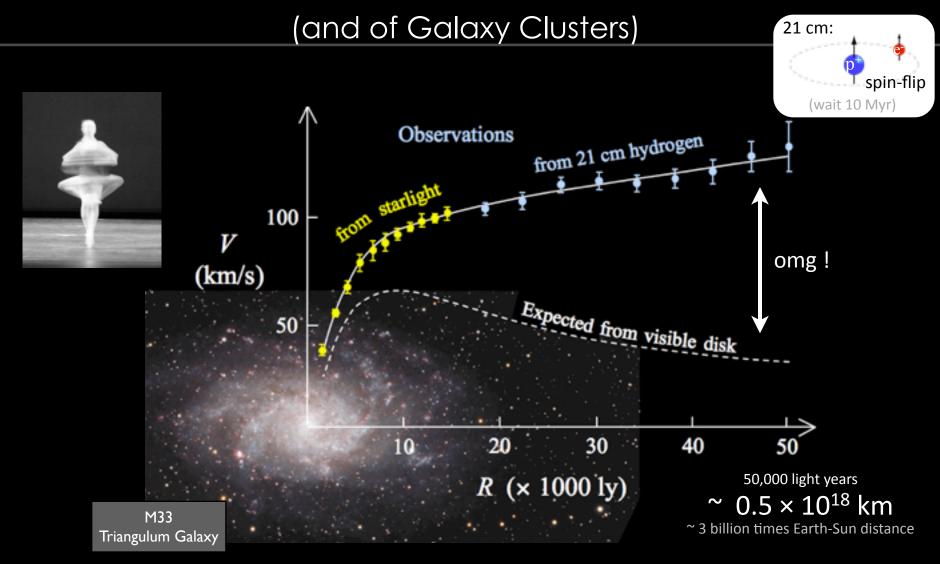

Rotation Curves of Galaxies

Something unknown is making galaxies spin like crazy

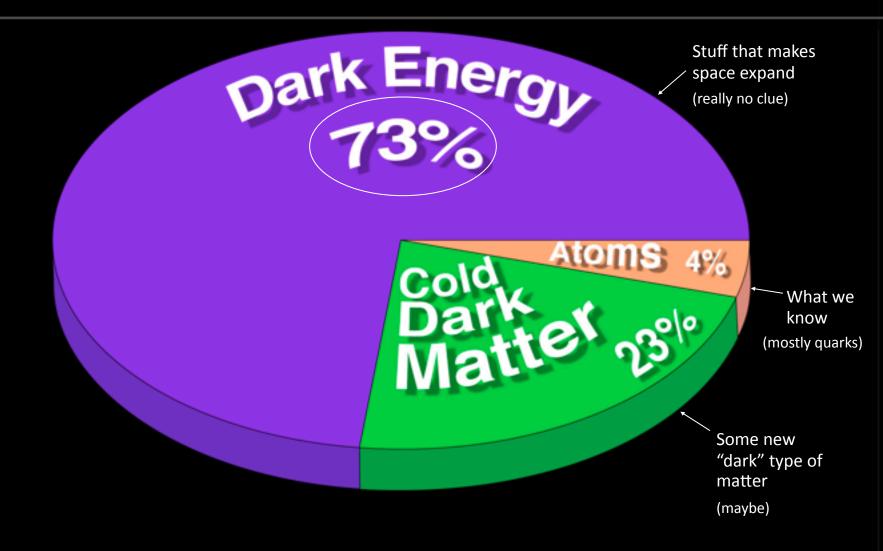

When Galaxies Collide

 August 2006: Clowe et al.: "A direct empirical proof of the existence of dark matter"

But we still don't know what "it" is Maybe we can make it in the LHC? Or "see" it in space or on Earth? Stay tuned...

Astrophysical Journal 648 L109-L113 (2006)

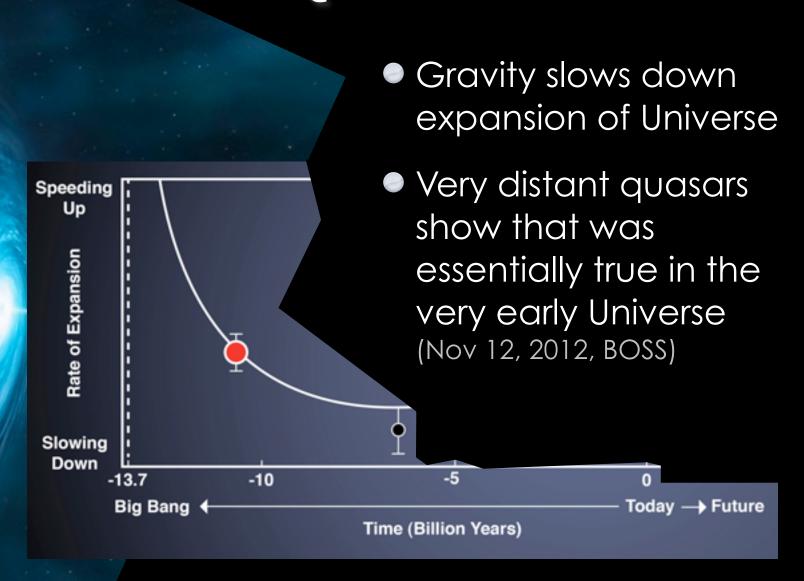

The Dark side of the Universe: 2

Quasars

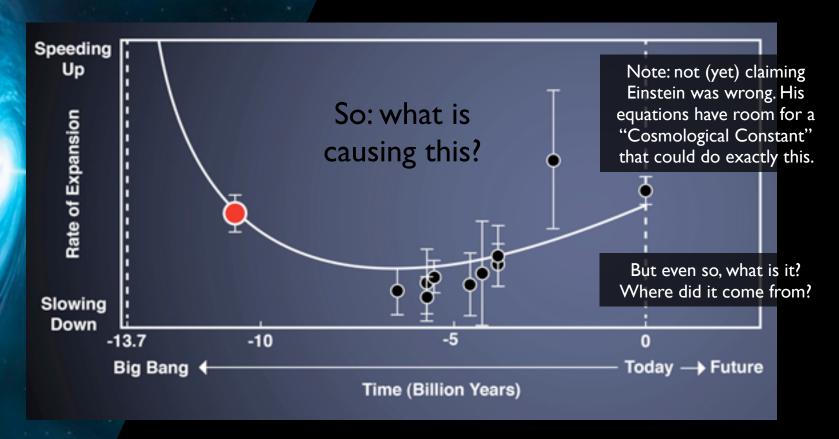

- Extremely far away →
 appear point-like
 ("Quasi-Stellar" → Quasar)
- The most luminous objects in the Universe
 → we can see them even when they're very, very far away (~ 10 billion light years) ...
- ... when the Universe was younger

Quasars

Quasars

 Gravity slows down expansion of Universe

Questions (for you?)

- What are Dark Matter and Dark Energy? Are they new "stuff" that obeys known laws, or are they new laws unto themselves? Or both?
- How well can you solve Quantum Field Theory? Without assuming things that aren't true? Fluctuations within fluctuations within fluctuations within fluctuations within fluctuations...
- Is 4 dimensions all there is? If more, how do they look? Is holography relevant?
- Where did the Higgs potential come from? How is it stable? What determines how particles couple to it? Is it fundamental? Are there more Higgs fields?
- Why does normal matter have heavier 'exotic' cousins? I.e., the other quarks and leptons. Do they play a role in some grander pattern?
- Why 4 fundamental forces? Are there more? Or are they really one?
- Why is there a bit more matter than antimatter around? (e.g., us)
- Also, what is quantum gravity? Superstrings? Or something else?
- Ideas are not enough. How to test! How to calculate!
